Description

Stretch-Hooders combine the weather protection and load stability advantages of shrinkwrapping, with the economy of stretchwrapping. A one-piece hood is made in the machine from a continuous roll of gusseted film. The hood is stretched over the load and secured under the pallet. The load is unitized without the cost of energy required for shrinkwrapping, saving the investment and space required for the shrink tunnel. Stretch Hooders are ideally suited to applications where pallet loads require five-sided protection, encounter stress during shipping or where products are sensitive to heat. The hood forms a smooth surface that is water tight and easily imprinted with logos or other advertising messages.

Vacuum film delivery option

Spreader-belt film delivery option

Hoist and dual film roll option

Automatic load profile scanner

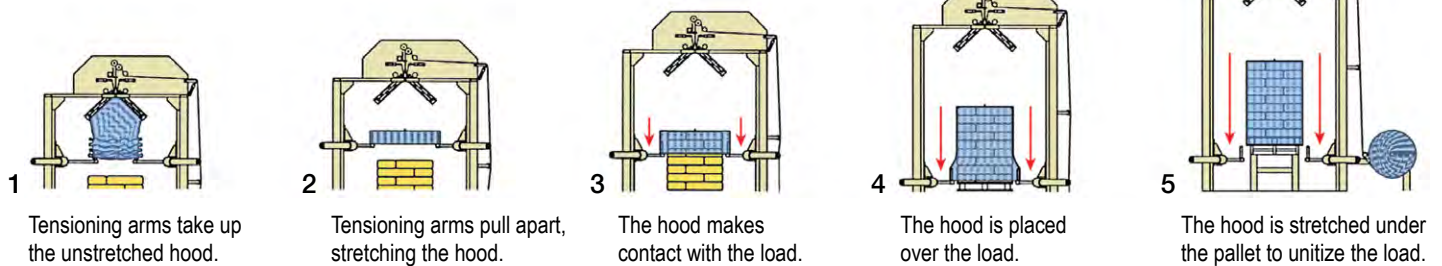

Features

- Fully automatic operation
- Handles a variety of load heights automatically, with optional height scanner
- Tubular film is automatically measured, cut and heat-sealed to form the hood
- Throughput is up to 120 units per hour, depending upon load height and length
- Maximum pallet size: 48" x 120" (For other sizes consult factory.)

Splicing table with clamps folds down allowing fast and easy film roll splicing

Operation

Complete Systems from One Source

Mollers North America also offers Valve Bag Packers and Placers, Conventional and Robotic Palletizing Options and Stretch-Hooding and Shrinkwrapping Systems for load protection and unitization.

Pack

Automatic placement and filling of valve bags

Palletize

Automatic palletizing of up to 3,000 bags per hour

Protect

5-sided protection with superior load unitization
